Face the facts.

For more facts and information about flu testing, and to test your knowledge, visit www.remel.com/flu.

Fact # 1

Regardless of the test used, the specimens **MUST** be collected correctly for optimal test results.

- Specimens should be collected early in the acute phase of infection.
- Swab specimens should be collected using swabs with a synthetic tip (e.g. polyester or Dacron®) and an aluminum or plastic shaft. Swabs with cotton tips and/or wooden shafts are not recommended. Specimens collected with swabs made of calcium alginate are not acceptable.

Fact # 2

Superior collection and transport media for respiratory viruses offers labs a wide range of benefits.

- MicroTest™ offers a dependable set of transport solutions designed to keep your lab moving in the right direction.
- The MicroTest product family provides versatility for many of your laboratory procedures, from specimen transport and holding to maintenance and long-term culture storage.

Fact # 3

For reliable respiratory results, choose high-performing rapid antigen tests for your laboratory.

- Xpect® Flu A&B and Xpect® RSV allow labs to maintain efficiency, productivity, and patient care during high volume testing.
- Results from Xpect Flu A&B and Xpect RSV allow physicians to make a rapid diagnosis with confidence, which is essential for reducing secondary testing, decreasing unnecessary antibiotic use, and guiding appropriate antiviral therapy.

Xpect®
